

# Package ‘SafeQuant’

December 6, 2016

**Type** Package

**Title** A Toolbox for the Analysis of Proteomics Data

**Version** 2.3.1

**Date** 2016-12-06

**Author** Erik Ahrne

**Maintainer** Erik Ahrne <erik.ahrne@unibas.ch>

**Description** Tools for the statistical analysis and visualization of (relative and absolute) quantitative (LFQ,TMT,HRM) Proteomics data.

**Imports** limma,

gplots,  
seqinr,  
corrplot,  
optparse,  
data.table,  
epiR,  
Biobase,

**License** GPL-3

**RoxygenNote** 5.0.1

---

addIdQvalues	<i>Add identification leve q-values to ExpressionSet (calculated based on target-decoy score distribution)</i>
--------------	--

---

## Description

Add identification leve q-values to ExpressionSet (calculated based on target-decoy score distribution)

## Usage

```
addIdQvalues(eset = eset)
```

## Arguments

eset	ExpressionSet
------	---------------

## Details

if ptm column is part if the ExpressionSet q-values are calculated seperately for modified and non-modified features

No details

## Value

ExpressionSet object

## Note

No note

## See Also

[getIdLevelQvals](#)

## Examples

```
print("No examples")
```

---

```
addScaffoldPTMFAnnotations
```

*Add scaffold ptm annotaitons to tmt experiment*

---

### Description

Add scaffold ptm annotaitons to tmt experiment

### Usage

```
addScaffoldPTMFAnnotations(eset, file)
```

### Arguments

eset	ExpressionSet
file	path to Scaffold file

### Value

ExpressionSet object

### Note

No note

### References

No references

### Examples

```
print("No examples")
```

---

```
barplotMSSignal
```

*Barplot of ms-signal per column*

---

### Description

Barplot of ms-signal per column

### Usage

```
barplotMSSignal(eset,
  col = as.character(.getConditionColors(eset)[pData(eset)$condition, ]),
  method = c("sum", "sharedSignal"), cex.lab = 1.25, cex.axis = 1.25,
  cex.names = 0.9, labels = rownames(pData(eset)), ...)
```

Arguments

eset	expressionSet
col	default condition colors
method	c("median","sum","sharedSignal")
cex.lab	default 1.25
cex.axis	default 1.25
cex.names	default 0.9
labels	labels
...	see plot

---

COLORS	<i>color vector</i>
--------	---------------------

---

Description

color vector

Usage

COLORS

Format

An object of class character of length 668.

---

createExpDesign	<i>Create Experimental Design</i>
-----------------	-----------------------------------

---

**Description**

Create Experimental Design

**Usage**

```
createExpDesign(tag, nbPlex)
```

**Arguments**

tag	user input tag e.g. 1,2,3:4,5,6 indicating two condition with 3 reps each
nbPlex	tmt 6 or 10 plex

**Details**

The first listed condition is always the control condition  
No details

**Value**

expDesign data.frame

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

createExpressionDataset	<i>Create ExpressionSet object</i>
-------------------------	------------------------------------

---

**Description**

Create ExpressionSet object

**Usage**

```
createExpressionDataset(expressionMatrix = expressionMatrix,  
  expDesign = expDesign, featureAnnotations = featureAnnotations)
```

**Arguments**

expressionMatrix      matrix of expression signals per feature and sample  
expDesign      experimental design data.frame  
featureAnnotations      data.frame including e.g: Protein Description, Id score etc.

**Details**

No details

**Value**

ExpressionSet object

**Note**

No note

**References**

NA

**See Also**

[ExpressionSet](#)

**Examples**

```
print("No examples")
```

---

createPairedExpDesign    *Create Paired Expdesign*

---

**Description**

Create Paired Expdesign

**Usage**

```
createPairedExpDesign(eset)
```

**Arguments**

eset      ExpressionSet

**Details**

Add subject colum to phenoData design data.frame

**Value**

ExpressionSet object

**Note**

No note

**References**

NA

**See Also**

[ExpressionSet](#)

**Examples**

```
print("No examples")
```

---

cvBoxplot	<i>C.V. boxplot</i>
-----------	---------------------

---

**Description**

C.V. boxplot

**Usage**

```
cvBoxplot(eset,  
  col = as.character(.getConditionColors(eset)[unique(pData(eset)$condition),  
    ]), cex.names = 0.9, cex.axis = 1.25, cex.lab = 1.25,  
  ylab = "C.V. (%)", ...)
```

**Arguments**

eset	ExpressionSet
col	col
cex.names	default 0.9
cex.axis	default 1.25
cex.lab	default 1.25
ylab	C.V.
...	see plot

**Details**

No details

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

```
expDesignTagToExpDesign
```

*Create experimental design data.frame from user input string*

---

**Description**

Create experimental design data.frame from user input string

**Usage**

```
expDesignTagToExpDesign(tag, expDesignDefault)
```

**Arguments**

tag	tag
expDesignDefault	data.frame

**Details**

tag: 1,2:3:4,5,6 condition isControl 1 Condition 1 TRUE 2 Condition 1 TRUE 3 Condition 1 TRUE  
4 Condition 2 FALSE 5 Condition 2 FALSE 6 Condition 2 FALSE

**Value**

data.frame describing experimental design

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

export	<i>Export content of safeQuantAnalysis object</i>
--------	---

---

**Description**

Export content of safeQuantAnalysis object

**Usage**

```
export(sqa, nbRows = nrow(sqa$pValue), file = NA)
```

**Arguments**

sqa	safeQuantAnalysis object
nbRows	Number of rows to export. Features are ordred by increasing minimal p.value
file	file path

**Details**

NA

**Note**

No note

**References**

NA

**See Also**

[safeQuantAnalysis](#)

**Examples**

```
print("No examples")
```

---

getAAProteinCoordinates	<i>Get amino acid coordinates on protein</i>
-------------------------	--

---

**Description**

Get amino acid coordinates on protein

**Usage**

```
getAAProteinCoordinates(peptideSeq, proteinSeq, aaRegExpr = "[STY]")
```

**Arguments**

peptideSeq	peptide sequence
proteinSeq	protein sequence
aaRegExpr	target AA reg exp

**Details**

NA

**Value**

vector of protein coordinates (mmodification residue number)

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getAllCV	<i>Calculate Coefficient of Variance per feature (Relative standard Deviation) per Condition</i>
----------	--

---

**Description**

Calculate Coefficient of Variance per feature (Relative standard Deviation) per Condition

**Usage**

```
getAllCV(eset)
```

**Arguments**

eset	ExpressionSet
------	---------------

**Details**

$CV = sd / mean$

**Value**

data.frame of CVs per condition

**Note**

No note

**References**

NA

**See Also**[getCV](#)**Examples**

```
print("No examples")
```

---

getAllEBayes	<i>Perform statistical test (mderated t-test), comparing all case to control</i>
--------------	--

---

**Description**

Perform statistical test (mderated t-test), comparing all case to control

**Usage**

```
getAllEBayes(eset = eset, adjust = F, log = T, method = "pairwise",
  adjustFilter = matrix(F, nrow = nrow(eset), ncol =
    length(levels(pData(eset)$condition)) - 1))
```

**Arguments**

eset	ExpressionSet
adjust	TRUE/FALSE adjust for multiple testing using Benjamini & Hochberg (1995)
method	method
log	T/F log-transform expression values
method	c("all","pairwise")
adjustFilter	matrix T/F do not adjust for multiple testing

**Details**

No details

**Value**

ExpressionSet object

**Note**

No note

**Examples**

```
print("No examples")
```

---

getBaselineIntensity	<i>Get signal at zscore x (x standard deviations below mean)</i>
----------------------	--

---

**Description**

Get signal at zscore x (x standard deviations below mean)

**Usage**

```
getBaselineIntensity(intensities, promille = 5)
```

**Arguments**

intensities	refrence run signals
promille	baseline value set as specified promille

**Value**

baseline value

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getCV	<i>Calculate Coefficient of Variance per feature (Relative standard Deviation)</i>
-------	--

---

**Description**

Calculate Coefficient of Variance per feature (Relative standard Deviation)

**Usage**

```
getCV(data)
```

**Arguments**

data	data.frame of replicate signals
------	---------------------------------

**Details**

CV = sd / mean

**Value**

vector of CVs

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

```
getExpDesignProgenesisCsv
```

*Parse Experimental Design from Progenesis Csv Export*

---

**Description**

Parse Experimental Design from Progenesis Csv Export

**Usage**

```
getExpDesignProgenesisCsv(file,  
  expressionColIndices = .getProgenesisCsvExpressionColIndices(file))
```

**Arguments**

file	path to progenesis csv file
expressionColIndices	default .getProgenesisCsvExpressionColIndices(file)

**Details**

No details

**Value**

data.frame describing experimental design

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getGlobalNormFactors	<i>Get normalization factors. calculated as summed/median signal per run (column) over summed/median of first run.</i>
----------------------	--

---

**Description**

Get normalization factors. calculated as summed/median signal per run (column) over summed/median of first run.

**Usage**

```
getGlobalNormFactors(eset, method = "median")
```

**Arguments**

eset	ExpressionSet
method	c("sum","median")

**Details**

No details

**Value**

vector of normalization factors

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getIBAQset	<i>Calculate intensity-based absolute-protein-quantification (iBAQ) metric per protein</i>
------------	--

---

## Description

Calculate intensity-based absolute-protein-quantification (iBAQ) metric per protein

## Usage

```
getIBAQset(eset, proteinDB = NA, peptideLength = c(5, 36),
  nbMiscleavages = 0, proteaseRegExp = .getProteaseRegExp("trypsin"))
```

## Arguments

eset	protein level ExpressionSet
proteinDB	list protein sequneces
peptideLength	peptide length interval (to get number of peptides used for normalization)
nbMiscleavages	number of mis-cleavages allowed when digesting protein sequneces in silico (to get number of peptides used for normalization)
proteaseRegExp	protease Reg Exp cleavage rule

## Details

No details

## Value

ExpressionSet

## Note

## Examples

```
print("No examples")
```

---

getIdLevelQvals	<i>Calculates identification level q-values based on target-decoy score distributions</i>
-----------------	---

---

**Description**

Calculates identification level q-values based on target-decoy score distributions

**Usage**

```
getIdLevelQvals(scores, isDecoy)
```

**Arguments**

scores	peptide/protein identificationscore
isDecoy	vector of TRUE/FALSE

**Details**

$q\text{-value} = (\text{Nb. Decoy Entries at idScore Threshold } S^*) / (\text{Nb. Target Entries at idScore Threshold } S)$ . (\* idScore  $\geq S$ )

**Value**

vector of q.values

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getImpuritiesMatrix	<i>Get Thermo TMT impurity matrix</i>
---------------------	---------------------------------------

---

**Description**

Get Thermo TMT impurity matrix

**Usage**

```
getImpuritiesMatrix(plexNb = 6)
```

**Arguments**

plexNb                      integer, 6 or 10 plex

**Details**

No details

**Value**

impurity matrix matrix

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getIntSumPerProtein	<i>Sum up raw intensities per protein and channel. keep track of number of summed spectra and unique peptides</i>
---------------------	---

---

**Description**

Sum up raw intensities per protein and channel. keep track of number of summed spectra and unique peptides

**Usage**

```
getIntSumPerProtein(intData, proteinACs, peptides, minNbPeptPerProt = 1)
```

**Arguments**

intData                      data.frame of intensities per channel  
proteinACs                   vector of protein accession numbers  
peptides                     vector of peptide sequneces  
minNbPeptPerProt             minimal number of peptides per protein

**Details**

NA

No details

**Value**

list containing 3 objects 1) data.frame of channel intensities per protein ac, 2) vector listing number of summed spectra per protein, 3) vector listing number of summed peptides per protein

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getLoocvFoldError	<i>Leave-One-Out Cross Validate Qunatification Model</i>
-------------------	--

---

**Description**

Leave-One-Out Cross Validate Qunatification Model

**Usage**

```
getLoocvFoldError(df)
```

**Arguments**

df                      data.frame of two columns 1) "signal" - ms metric 2) "cpc" absolute quantity

**Details**

No details

**Value**

data.frame of fold errors per (left-out) protein

**Note**

No note

**References**

NA

**See Also**

NA

**Examples**

```
print("No examples")
```

---

getMaxIndex	<i>get index of max in vecotr of numeric values</i>
-------------	---

---

**Description**

get index of max in vecotr of numeric values

**Usage**

```
getMaxIndex(v)
```

**Arguments**

v	vector
---	--------

---

getMeanCenteredRange	<i>Get modification coordinates on protein</i>
----------------------	--

---

**Description**

Get modification coordinates on protein

**Usage**

```
getMeanCenteredRange(d, nbSd = 4)
```

**Arguments**

d	numeric vector
nbSd	range spanning number of sd frmo mean

**Details**

NA

**Value**

vector range boundries

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`getModifProteinCoordinates`*Get modification coordinates on protein*

---

**Description**

Get modification coordinates on protein

**Usage**

```
getModifProteinCoordinates(modifAnnot, peptideSeq, proteinSeq, format = 1)
```

**Arguments**

<code>modifAnnot</code>	modification as annotated by progenesis. E.g. '[15] Phospho (ST)[30] Phospho (ST)'
<code>peptideSeq</code>	peptide sequence
<code>proteinSeq</code>	protein sequence
<code>format</code>	c(1,2) 1. progenesis 2. scaffold

**Details**

NA

**Value**

vector of protein coordinates (mmodification residue number)

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`getMotifX`*Create motif-x peptide annotation*

---

### Description

Create motif-x peptide annotation

### Usage

```
getMotifX(modifPos, peptide, proteinSeq, motifLength = 4)
```

### Arguments

<code>modifPos</code>	vector positions
<code>peptide</code>	peptide sequence
<code>proteinSeq</code>	protein sequence
<code>motifLength</code>	motif flanking sequence

### Details

motif-x example PGDYS\*TTPG

### Value

vector of motifs

### Note

No note

### References

NA

### Examples

```
print("No examples")
```

---

`getNbDetectablePeptides`*Get number peptides passing defined length criteria*

---

**Description**

Get number peptides passing defined length criteria

**Usage**

```
getNbDetectablePeptides(peptides, peptideLength = c(5, 36))
```

**Arguments**

peptides	list of peptides
peptideLength	vector of two integers defining peptide length range

**Details**

No details

**Value**

integer corresponding to number of detectable peptides

**Note**

No note

**Examples**

```
print("No examples")
```

---

`getNbMisCleavages`*Get number of mis-cleavages perp peptide*

---

**Description**

Get number of mis-cleavages perp peptide

**Usage**

```
getNbMisCleavages(peptide, protease = "trypsin")
```

**Arguments**

peptide	character vector
protease	regular expression

**Details**

NA

**Value**

vector of integers

**Note**

No note

**References**

NA

**Examples**

print("No examples")

---

getNbPeptidesPerProtein  
*Get number of peptides per protein*

---

**Description**

Get number of peptides per protein

**Usage**

getNbPeptidesPerProtein(eset)

**Arguments**

eset                      ExpressionSet

**Details**

NA

**Value**

table

**Note**

No note

**References**

NA

**Examples**

print("No examples")

---

`getNbSpectraPerProtein`*Get number of spectra per protein*

---

**Description**

Get number of spectra per protein

**Usage**

```
getNbSpectraPerProtein(eset)
```

**Arguments**

eset	ExpressionSet
------	---------------

**Details**

NA

**Value**

table

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`getPeptides`*Digest protein*

---

**Description**

Digest protein

**Usage**

```
getPeptides(proteinSeq, proteaseRegExp = .getProteaseRegExp("trypsin"),  
            nbMisleavages = 0)
```

**Arguments**

proteinSeq      protein sequence  
proteaseRegExp   protease Regular Expression  
nbMisleavages   default 0

**Details**

No details

**Value**

vector of peptides

**Note**

No note

**Examples**

```
print("No examples")
```

---

getRatios

*Calculate ratios, comparing all case to control*

---

**Description**

Calculate ratios, comparing all case to control

**Usage**

```
getRatios(eset, method = "median", log2 = T)
```

**Arguments**

eset              ExpressionSet  
method           median, mean, paired  
log2              transform

**Details**

No details

**Value**

ExpressionSet object

**Note**

No note

## References

NA

## Examples

```
print("No examples")
```

---

getRTNormFactors	<i>Get retentiontime base normalization factors</i>
------------------	---

---

## Description

Get retentiontime base normalization factors

## Usage

```
getRTNormFactors(eset, minFeaturesPerBin = 100)
```

## Arguments

eset	ExpressionSet
minFeaturesPerBin	minumum number of features per bin. If nb. features are < minFeaturesPerBin -> include neighbouring bins.

## Details

No details

## Value

data.frame normalization factors per retention time bin (minute)

## Note

No note

## References

In Silico Instrumental Response Correction Improves Precision of Label-free Proteomics and Accuracy of Proteomics-based Predictive Models, Lyutvinskiy et al. (2013), <http://www.ncbi.nlm.nih.gov/pubmed/23589346>

## Examples

```
print("No examples")
```

---

getScoreCutoff	<i>Get score cutoff for a given fdr cut-off</i>
----------------	---

---

**Description**

Get score cutoff for a given fdr cut-off

**Usage**

```
getScoreCutoff(scores, isDecoy, fdrCutoff = 0.01)
```

**Arguments**

scores	peptide/protein identificationscore
isDecoy	vector of TRUE/FALSE
fdrCutoff	[0,1]

**Details**

NA

**Value**

scoreCutoff

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getSignalPerCondition	<i>Summarize replicate signal per condition (min)</i>
-----------------------	---

---

**Description**

Summarize replicate signal per condition (min)

**Usage**

```
getSignalPerCondition(eset, method = "median")
```

**Arguments**

eset	ExpressionSet
method	median (default), mean, max, min, sd

**Details**

No details

**Value**

data.frame of per condition signals

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

getTopX

*Calculate Mean of X most intense features*

---

**Description**

Calculate Mean of X most intense features

**Usage**

```
getTopX(entryData, topX = 3)
```

**Arguments**

entryData	data.frame listing feature intensities of one entry. Typically rows corresponds to Peptide entries of one protein
topX	best X flyers

**Details**

No details

**Value**

vector of topX intensities per column (sample)

**Note**

No note

globalNormalize	<i>Normalize, Norm factors calculated as median signal per run (column) over median of first run.</i>
-----------------	---

---

**Description**

Normalize, Norm factors calculated as median signal per run (column) over median of first run.

**Usage**

```
globalNormalize(eset, globalNormFactors)
```

**Arguments**

eset	ExpressionSet
globalNormFactors	globalNormFactors

**Details**

No details

**Value**

eset ExpressionSet

**Note**

No note

**References**

NA

**See Also**

getGlobalNormFactors

**Examples**

```
print("No examples")
```

---

hClustHeatMap	<i>Hierarchical clustering heat map, cluster by runs intensity, features by ratio and display log2 ratios to control median</i>
---------------	---

---

**Description**

Hierarchical clustering heat map, cluster by runs intensity, features by ratio and display log2 ratios to control median

**Usage**

```
hClustHeatMap(eset, conditionColors = .getConditionColors(eset),  
  breaks = seq(-2, 2, length = 20), dendogram = "column",  
  legendPos = "left", ...)
```

**Arguments**

eset	ExpressionSet
conditionColors	data.frame of colors per condition
breaks	default seq(-2,2,length=20)
dendogram	see heatmap.2 gplots
legendPos	see legend
...	see plot

---

isCon	<i>Check if protein is a contaminant entry</i>
-------	--

---

**Description**

Check if protein is a contaminant entry

**Usage**

```
isCon(ac)
```

**Arguments**

ac                      vector of protein accession numbers

**Details**

contaminants proteins are typically annotated as: CON\_P0000

**Value**

vector TRUE/FALSE

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

isDecoy	<i>Check if protein is a decoy entry</i>
---------	--

---

**Description**

Check if protein is a decoy entry

**Usage**

```
isDecoy(ac)
```

**Arguments**

ac                      vector of protein accession numbers

**Details**

decoy proteins are typically annotated as: REV\_P0000

**Value**

vector TRUE/FALSE

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

isStrippedACs	<i>Check if ACs are in "non-stripped" uniprot format e.g. "sp Q8CHJ2 AQP12_MOUSE"</i>
---------------	---

---

**Description**

Check if ACs are in "non-stripped" uniprot format e.g. "sp|Q8CHJ2|AQP12\_MOUSE"

**Usage**

```
isStrippedACs(acs)
```

**Arguments**

acs                      accession numbers

**Details**

TRUE if less than 10

**Value**

boolean TRUE/FALSE

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`maPlotSQ`*ma-plot*

---

**Description**

ma-plot

**Usage**

```
maPlotSQ(eset, sample = colnames(exprs(eset))[1], cex.lab = 1.5,  
  cex.axis = 1.5, lwd = 2, pch = 1, col = rgb(0, 100, 0, 50,  
  maxColorValue = 255), ...)
```

**Arguments**

<code>eset</code>	ExpressionSet
<code>sample</code>	selected condition
<code>cex.lab</code>	default 1.5
<code>cex.axis</code>	default 1.5
<code>lwd</code>	default 2
<code>pch</code>	default 1
<code>col</code>	green transparent
<code>...</code>	see plot

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`missinValueBarplot`*Plot Percentage of Features with with missing values*

---

**Description**

Plot Percentage of Features with with missing values

**Usage**

```
missinValueBarplot(eset,  
  col = as.character(.getConditionColors(eset)[pData(eset)$condition, ]),  
  cex.axis = 1.25, cex.lab = 1.25, ...)
```

**Arguments**

eset	ExpressionSet
col	col
cex.axis	cex.axis
cex.lab	cex.lab
...	see plot

**Details**

No details

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

option_list	<i>Command Line Option List</i>
-------------	---------------------------------

---

**Description**

Command Line Option List

**Usage**

```
option_list
```

**Format**

An object of class list of length 29.

---

pairsAnnot	<i>Plot lower triangle Pearsons <math>R^2</math>. Diagonal text, upper triangle all against all scatter plots with lm abline</i>
------------	--

---

**Description**

Plot lower triangle Pearsons  $R^2$ . Diagonal text, upper triangle all against all scatter plots with lm abline

**Usage**

```
pairsAnnot(data, textCol = rep(1, ncol(data)), diagText = colnames(data),  
  col = rgb(0, 100, 0, 50, maxColorValue = 255), isHeatCol = F,  
  cexTxt = 2, ...)
```

**Arguments**

data	data.frame
textCol	text color
diagText	diagnoal text
col	dot col
isHeatCol	heat colors
cexTxt	cex txt
...	see plot

parseScaffoldPTMReport	
Parse scaffold PTM Spectrum Report	
Description	
Parse scaffold PTM Spectrum Report	
Usage	
parseScaffoldPTMReport(file)	
Arguments	
file	path to Scaffold file
Details	
No details	
Value	
data.frame	
Note	
No note	
References	
NA	
Examples	
print("No examples")	
parseScaffoldRawFile	
Parse scaffold output .xls file (RAW export)	

Description

Parse scaffold output .xls file (RAW export)

Usage

```
parseScaffoldRawFile(file, expDesign = expDesign, keepFirstAcOnly = FALSE,
  isPurityCorrect = T)
```

**Arguments**

file	path to Scaffold file
expDesign	experimental design data.frame
keepFirstAcOnly	TRUE/FALSE If multiple ACs in Accession.Numbers filed. Then keep the first one only
isPurityCorrect	do purity correction

---

```
plotAbsEstCalibrationCurve
```

*Plot absolut Estimation calibration Curve*

---

**Description**

Plot absolut Estimation calibration Curve

**Usage**

```
plotAbsEstCalibrationCurve(fit, dispElements = c("formula", "lowess",
  "stats"), xlab = "Conc. (CPC) ", ylab = "Pred. Conc. (CPC) ",
  predictorName = paste("log10(", names(coef(fit))[2], ")", sep = ""),
  text = F, cex.lab = 1, cex.axis = 1, cex.text = 1, cex.dot = 1,
  main = "", ...)
```

**Arguments**

fit	simple log-linear model
dispElements	c("formula","lowess","stats")
xlab	xlab
ylab	ylab
predictorName	predictorName
text	add names beside each dot
cex.lab	expansion factor for axis labels
cex.axis	expansion factor for axis
cex.text	expansion factor for legend
cex.dot	expansion factor for plotted dots
main	main
...	see plot

`plotNbValidDeFeaturesPerFDR`*Plot Total Number of differentially Abundant Features (applying ratio cutoff) vs. qValue/pValue for all conditions*

---

**Description**

Plot Total Number of differentially Abundant Features (applying ratio cutoff) vs. qValue/pValue for all conditions

**Usage**

```
plotNbValidDeFeaturesPerFDR(sqa, upRegulated = T, log2RatioCufOff = log2(1),  
  pvalCutOff = 1, isLegend = T, isAdjusted = T, ylab = "Nb. Features",  
  xlim = NA, ylim = NA, ...)
```

**Arguments**

<code>sqa</code>	SafeQuantAnalysis Object
<code>upRegulated</code>	TRUE/FALSE select for upregulated features
<code>log2RatioCufOff</code>	log2 ratio cut-off
<code>pvalCutOff</code>	pValue/qValue cut-off
<code>isLegend</code>	TRUE/FALSE display legend
<code>isAdjusted</code>	TRUE/FALSE qValues/pValue on x-axis
<code>ylab</code>	default Nb. Features
<code>xlim</code>	see plot
<code>ylim</code>	see plot
<code>...</code>	see plot

**Description**

Plot Number of Identifications vs. FDR

**Usage**

```
plotROC(qvals, qvalueThrs = 0.01, xlab = "False Discovery Rate",  
        ylab = "Nb. Valid Identifications", xlim = c(0, 0.1), breaks = 100,  
        col = "blue", lwd = 1.5, ...)
```

**Arguments**

<code>qvals</code>	vector of q-values
<code>qvalueThrs</code>	threshold indicated by vertical line
<code>xlab</code>	default "False Discovery Rate"
<code>ylab</code>	default "Nb. Valid Identifications"
<code>xlim</code>	default c(0,0.1)
<code>breaks</code>	see breaks for hist function
<code>col</code>	default blue
<code>lwd</code>	default 1.5
<code>...</code>	see plot

`plotRTNorm`*Plot all retention time profile overalying ratios*

---

**Description**

Plot all retention time profile overalying ratios

**Usage**

```
plotRTNorm(rtNormFactors, eset, samples = 1:ncol(rtNormFactors), main = "",
...)
```

**Arguments**

<code>rtNormFactors</code>	data.frame of normalization factor per r.t bin and sample, obtained by <code>getRTNormFactors</code>
<code>eset</code>	ExprssionSet
<code>samples</code>	specify samples (sample numbers) to be plotted
<code>main</code>	main
<code>...</code>	see plot see plot

------------------	---

---

## Description

Correct channel intensities based on Reporter ion Isotopic Distributions

## Usage

```
purityCorrectTMT(tmtData, impurityMatrix = impurityMatrix)
```

## Arguments

tmtData            data.frame containing tmt channel intensities

impurityMatrix    correction matrix

## Details

Same method as MSnbase, and described in Breitwieser et al. 2012 (Book Chapter)

## Value

data.frame of corrected tmt intensities

## Note

No note
