Title Design and Analysis of Hierarchical Composite Endpoints

Version 0.8.5

**Description** Simulate and analyze hierarchical composite endpoints. Includes implementation for the kidney hierarchical composite endpoint as defined in Heerspink HL et al (2023) "Development and validation of a new hierarchical composite end point for clinical trials of kidney disease progression" (Journal of the American Society of Nephrology 34 (2): 2025–2038, <doi:10.1681/ASN.000000000000243>). Win odds, also called Wilcoxon-Mann-Whitney or success odds, is the main analysis method. Other win statistics (win probability, win ratio, net benefit) are also implemented in the univariate case, provided there is no censoring. The win probability analysis is based on the Brunner-Munzel test and uses the DeLong-DeLong-Clarke-Pearson variance estimator, as described by Brunner and Konietschke (2025) in "An unbiased rank-based estimator of the Mann-Whitney variance including the case of ties" (Statistical Papers 66 (1): 20, <doi:10.1007/s00362-024-01635-0>). Stratification and covariate adjustment are performed based on the methodology presented by Koch GG et al. in "Issues for covariance analysis of dichotomous and ordered categorical data from randomized clinical trials and non-parametric strategies for addressing them" (Statistics in Medicine 17 (15-16): 1863–92). For a review, see Gasparyan SB et al (2021) "Adjusted win ratio with stratification: Calculation methods and interpretation" (Statistical Methods in Medical Research 30 (2): 580–611, <doi:10.1177/0962280220942558>).

ADET

Event-Time dataset for kidney outcomes.

## **Description**

A dataset with multiple kidney outcomes over time scale outcomes of 1500 patients in the ADSL dataset.

## Usage

**ADET** 

#### **Format**

a data frame with 604 rows (events) and 6 variables:

**ID** patient identifiers, numeric

AVAL occurence time of the event, numeric

PARAM name of the event, character

PARAMCD coded name of the event, character

PARAMN type of the event, outcomes 1-7, where a higher value means a better outcome, numeric

TRTPN treatment values, 1 Active or 2 Placebo, numeric

#### Source

Heerspink HL et al "Development and validation of a new hierarchical composite endpoint for clinical trials of kidney disease progression." Journal of the American Society of Nephrology (2023): doi:10.1681/ASN.0000000000000243.

```
head(ADET)
# Number of unique patients
length(unique(ADET$ID))
# Number of events per event type
barplot(table(ADET$PARAM))
```

4 ADLB

ADLB Laboratory dataset for Glomerular Filtration Rate (GFR) measurements.

## **Description**

A dataset of laboratory measurements of kidney function over time for the 1500 patients in the ADSL dataset.

## Usage

ADLB

#### **Format**

a data frame with 13980 rows and 8 variables:

**ID** patient identifiers, numeric

TRTPN treatment values, 1 Active or 2 Placebo, numeric

AVAL measurement value, numeric

ADAY measurement day in the study, numeric

**AVISITN** hospital visit number, numeric

PARAM name of the event, GFR measurements, character

PARAMCD coded name of the event, GFR, character

PARAMN type of the event is set to 7 for all measurements, numeric

## Source

Heerspink HL et al "Development and validation of a new hierarchical composite endpoint for clinical trials of kidney disease progression." Journal of the American Society of Nephrology (2023): doi:10.1681/ASN.0000000000000243.

## **Examples**

head(ADLB)

ADSL 5

ADSL	Baseline characteristics dataset of patients with kidney function assessments.

## **Description**

A data frame with baseline characteristics for 1500 patients used to derive KHCE dataset.

## Usage

**ADSL** 

#### **Format**

a data frame with 1500 rows and 4 variables:

**ID** patient identifiers, numeric

TRTPN treatment values, 1 Active or 2 Placebo, numeric

EGFRBL Baseline GFR values of patients, numeric

STRATAN strata 1-4, higher value means a higher risk for kidney disease progression, numeric

#### **Source**

dat <- KHCE
class(dat) <- "moo" # non-existent class
as_hce(dat) # tries to convert to an hce object</pre>
```

8 calcWINS.data.frame

calcWINS

A generic function for calculating win statistics

## Description

A generic function for calculating win statistics

#### Usage

```
calcWINS(x, ...)
```

## Arguments

an object used to select a method.

... further arguments passed to or from other methods.

#### Value

a data frame containing calculated values.

#### See Also

```
calcWINS.hce(), calcWINS.formula(), calcWINS.data.frame() methods.
```

calcWINS.data.frame

Win statistics calculation using a data frame

## **Description**

Win statistics calculation using a data frame

## Usage

```
## $3 method for class 'data.frame'
calcWINS(
    x,
    AVAL,
    TRTP,
    ref,
    alpha = 0.05,
    WOnull = 1,
    SE_WP_Type = c("biased", "unbiased"),
    ...
)
```

calcWINS.data.frame 9

#### **Arguments**

x a data frame containing subject-level data.

AVAL variable in the data with ordinal analysis values.

TRTP the treatment variable in the data.

ref the reference treatment group.

alpha 2-sided significance level. The default is 0.05.

WOnull the null hypothesis. The default is 1.

SE\_WP\_Type biased or unbiased standard error for win probability. The default is biased.

... additional parameters.

#### **Details**

When SE\_WP\_Type = "unbiased", the calculations for win proportion, net benefit, and win odds utilize the unbiased standard error from Brunner-Konietschke (2025) paper which is a reformulation of the original formula proposed by Bamber (1975).

#### Value

a list containing win statistics and their confidence intervals. It contains the following named data frames:

- summary a data frame containing number of wins, losses, and ties of the active treatment group and the overall number of comparisons.
- WP a data frame containing the win probability and its confidence interval.
- NetBenefit a data frame containing the net benefit and its confidence interval. This is just a 2x-1 transformation of WP and its CI.
- WO a data frame containing the win odds and its confidence interval.
- WR1 a data frame containing the win ratio and its confidence interval, using the transformed standard error of the gamma statistic.
- WR2 a data frame containing the win ratio and its confidence interval, using the standard error calculated using Pties.
- gamma a data frame containing Goodman Kruskal's gamma and its confidence interval.
- SE a data frame containing standard errors used to calculated the Confidence intervals for win statistics.

```

calcW0

A generic function for calculating win odds

#### **Description**

A generic function for calculating win odds

## Usage

```
calcWO(x, ...)
```

#### **Arguments**

x an object used to select a method.

... further arguments passed to or from other methods.

calcWO.data.frame

#### Value

a data frame containing calculated values.

#### See Also

```
calcWO.hce(), calcWO.formula(), calcWO.data.frame() methods.
```

calcWO.data.frame

Win odds calculation using a data frame

#### **Description**

Win odds calculation using a data frame

#### Usage

```
## S3 method for class 'data.frame'
calcWO(x, AVAL, TRTP, ref, alpha = 0.05, WOnull = 1, ...)
```

#### **Arguments**

x a data frame containing subject-level data.

AVAL variable in the data with ordinal analysis values.

TRTP the treatment variable in the data.

ref the reference treatment group.

alpha significance level. The default is 0.05.

WOnull the null hypothesis. The default is 1.

... additional parameters.

#### Value

a data frame containing the win odds and its confidence interval. It contains the following columns:

- WO calculated win odds.
- · LCL lower confidence limit.
- UCL upper confidence limit.
- SE standard error of the win odds.
- WOnull win odds of the null hypothesis (specified in the WOnull argument).
- alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).
- Pvalue p-value associated with testing the null hypothesis.
- WP calculated win probability.
- LCL\_WP lower confidence limit for WP.

18 calcWO.formula

- UCL\_WP upper confidence limit for WP.
- SE\_WP standard error of the win probability.
- SD\_WP standard deviation of the win probability, calculated as SE\_WP multiplied by sqrt(N).
- N total number of patients in the analysis.

#### References

Gasparyan SB et al. "Adjusted win ratio with stratification: calculation methods and interpretation." Statistical Methods in Medical Research 30.2 (2021): 580-611. doi:10.1177/0962280220942558

#### See Also

```

## **Examples**

```
data(HCE4)
calcWO(x = HCE4, AVAL = "AVAL", TRTP = "TRTP", ref = "P")
```

calcWO.formula

Win odds calculation using formula syntax

#### **Description**

Win odds calculation using formula syntax

#### Usage

```
## S3 method for class 'formula'
calcWO(x, data, ...)
```

#### **Arguments**

x an object of class formula.

data a data frame.

... additional parameters.

#### Value

a data frame containing the win odds and its confidence interval. It contains the following columns:

- WO calculated win odds.
- LCL lower confidence limit.
- UCL upper confidence limit.
- SE standard error of the win odds.
- WOnull win odds of the null hypothesis (specified in the WOnull argument).

calcWO.hce 19

• alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).

- Pvalue p-value associated with testing the null hypothesis.
- WP calculated win probability.
- LCL\_WP lower confidence limit for WP.
- UCL\_WP upper confidence limit for WP.
- SE\_WP standard error of the win probability.
- SD\_WP standard deviation of the win probability, calculated as SE\_WP multiplied by sqrt(N).
- N total number of patients in the analysis.
- formula returning the specified formula in the x argument.
- ref showing how the reference group was selected. Can be modifying by specifying the ref argument.

calcWO.hce

Win odds calculation for hee objects

## **Description**

Win odds calculation for hce objects

#### Usage

```
## S3 method for class 'hce' calcWO(x, ...)
```

20 calcWO.hce

#### **Arguments**

x an hce object.

... additional parameters.

#### Value

a data frame containing the win odds and its confidence interval. It contains the following columns:

- · WO calculated win odds.
- LCL lower confidence limit.
- UCL upper confidence limit.
- SE standard error of the win odds.
- WOnull win odds of the null hypothesis (specified in the WOnull argument).
- alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).
- Pvalue p-value associated with testing the null hypothesis.
- WP calculated win probability.
- LCL\_WP lower confidence limit for WP.

COVID19 21

COVID19

COVID-19 ordinal scale dataset (full report).

## Description

A dataset with COVID-19 ordinal scale outcomes for 1062 patients.

#### Usage

COVID19

#### **Format**

a data frame with 1062 rows and 2 variables:

**GROUP** type of the event, ordinal outcomes 1-8, where a higher value means a better outcome **TRTP** treatment values, A Active or P Placebo, character

#### **Source**

Beigel JH et al. "Remdesivir for the treatment of Covid-19-final report." New England Journal of Medicine 383.19 (2020): 1813-1836. doi:10.1056/NEJMoa2007764.

## Examples

```
#Frequencies
table(COVID19)
mosaicplot(table(COVID19), col = c(1, 8, 6, 2, 4, 5, 3, 7),
xlab = "Treatment", ylab = "Ordinal Scale", main = "COVID-19 ordinal scale")
# Convert to an hce object
COVID19HCE <- hce(GROUP = COVID19$GROUP, TRTP = COVID19$TRTP)
# Summary wins, losses, and ties with win odds
summaryWO(COVID19HCE, ref = "Placebo")</pre>
```

COVID19b

COVID-19 ordinal scale dataset (preliminary report).

## **Description**

A dataset with COVID-19 ordinal scale outcomes for 844 patients.

## Usage

COVID19b

22 COVID19plus

#### **Format**

a data frame with 844 rows and 2 variables:

**GROUP** type of the event, ordinal outcomes 1-8, where a higher value means a better outcome **TRTP** treatment values, Active or Placebo, character

#### Source

Beigel JH et al. "Remdesivir for the treatment of Covid-19-final report." New England Journal of Medicine 383.19 (2020): 1813-1836. doi:10.1056/NEJMoa2007764.

#### **Examples**

```
#Frequencies
table(COVID19b)
mosaicplot(table(COVID19b), col = c(1, 8, 6, 2, 4, 5, 3, 7),
xlab = "Treatment", ylab = "Ordinal Scale", main = "COVID-19 ordinal scale")
# Calculate win statistics
calcWINS(x = COVID19b, AVAL = "GROUP", TRTP = "TRTP", ref = "Placebo")
```

COVID19plus

COVID-19 ordinal scale dataset for a combination therapy.

#### Description

A dataset with COVID-19 ordinal scale outcomes for 1033 patients.

## Usage

COVID19plus

#### **Format**

a data frame with 1033 rows and 4 variables:

ID patient identifiers, numeric

TRTP treatment values, A Active or P Placebo, character

**GROUP** type of the event, ordinal outcomes 1-8, where a higher value means a better outcome **BASE** baseline ordinal values

#### Source

Kalil AC et al. "Baricitinib plus Remdesivir for Hospitalized Adults with Covid-19." New England Journal of Medicine 384.9 (2021): 795-807. doi:10.1056/NEJMoa2031994.

```
COVID19HCE <- hce(GROUP = COVID19plus$GROUP, TRTP = COVID19plus$TRTP)
# Summary wins, losses, and ties with win odds
summaryWO(COVID19HCE, ref = "P")</pre>
```

hce 23

h	-	0

Helper function for hce objects

#### **Description**

Helper function for hce objects

## Usage

```
hce(GROUP, TRTP, AVAL0 = NULL, PADY = NULL)
```

## **Arguments**

GROUP	a character vector or a factor containing events. If a factor, its levels are used to define the hierarchy. Otherwise, the vector is converted to a factor.
TRTP	a character vector of the same length as $GROUP$ , indicating assigned treatment groups.
AVAL0	a numeric vector of the same length as GROUP, indicating containing analysis values within each category. The default is 0.
PADY	numeric specifying the length of follow-up in years.

#### Value

an object of class hee or adhee (if AVAL0 is provided). The result is a subject-level data frame, where each row corresponds to one subject,

#### See Also

as\_hce() for coercing to hce objects.

```
# Example 1 - Both `AVALO` and `PADY` are provided. The output is an `adhce` object.
GROUP <- COVID19$GROUP
TRTP <- rep(c("A", "P"), each = 531)
dat <- hce(GROUP, TRTP, PADY = 10, AVAL0 = rnorm(1062))</pre>
class(dat)
calcWO(dat)
summaryWO(dat) # Uses the `GROUP` variable for summary.
# Example 2 - Only `AVALO` is provided, `PADY` is calculated as the maximum of `AVALO`.
# The output is an `adhce` object.
set.seed(2022)
d \leftarrow hce(GROUP = sample(x = c("A", "B", "C"), size = 10, replace = TRUE),
TRTP = rep(c("Active", "Control"), each = 5),
AVAL0 = c(rnorm(5, mean = 1), rnorm(5)))
calcWO(d, ref = "Control")
## modify the hierarchy by proving a factor for the GROUP variable.
## calcWO() applied to an hce rederives `AVAL` based on the `GROUP` variable.
```

24 HCE1

```
d$GROUP <- factor(d$GROUP, levels = c("C", "B", "A"))
calcWO(d, ref = "Control")
# Example 3 - Provide only `PADY` and not `AVALO` will not make any difference.
GROUP <- COVID19$GROUP
TRTP <- rep(c("A", "P"), each = 531)
dat <- hce(GROUP, TRTP, PADY = 10)
class(dat)
calcWO(dat)
dat <- hce(GROUP, TRTP)
class(dat)
calcWO(dat)</pre>
```

HCE1

HCE1, HCE2, HCE3, HCE4 datasets for 1000 patients with different treatment effects.

## Description

A simulated dataset containing the ordinal values and other attributes for 1000 patients. HCE1

#### Usage

HCE1

#### **Format**

a data frame with 1000 rows and 6 variables:

ID subject ID, numbers from 1 to 1000

TRTP treatment values, A Active or P Placebo, character

GROUP type of the event, either Time-To-Event (TTE) or Continuous (C), character

**GROUPN** type of the event, for the ordering of outcomes in the GROUP variable, numeric

**AVALT** the timing of the time-to-event outcomes, numeric

**AVAL0** original values for each type of the event, time for TTE outcomes, numeric values for Continuous outcomes, numeric

**AVAL** AVAL = AVAL0 + GROUPN, ordinal analysis values for the HCE analysis. For the continuous outcome the values of AVAL0 are shifted to start always from 0. Numeric, but caution NOT to apply numeric operations; will give meaningless results

PADY primary analysis day, the length of fixed follow-up in days, numeric

HCE2 25

HCE2	HCE1, HCE2, HCE3, HCE4 datasets for 1000 patients with different treatment effects.

## **Description**

A simulated dataset containing the ordinal values and other attributes for 1000 patients. HCE2

## Usage

HCE<sub>2</sub>

#### **Format**

a data frame with 1000 rows and 6 variables:

**ID** subject ID, numbers from 1 to 1000

TRTP treatment values, A Active or P Placebo, character

GROUP type of the event, either Time-To-Event (TTE) or Continuous (C), character

**GROUPN** type of the event, for the ordering of outcomes in the GROUP variable, numeric

**AVALT** the timing of the time-to-event outcomes, numeric

**AVAL0** original values for each type of the event, time for TTE outcomes, numeric values for Continuous outcomes, numeric

**AVAL** AVAL = AVAL0 + GROUPN, ordinal analysis values for the HCE analysis. For the continuous outcome the values of AVAL0 are shifted to start always from 0. Numeric, but caution NOT to apply numeric operations; will give meaningless results

PADY primary analysis day, the length of fixed follow-up in days, numeric

HCE3	HCE1, HCE2, HCE3, HCE4 datasets for $1000$ patients with different treatment effects.

## **Description**

A simulated dataset containing the ordinal values and other attributes for 1000 patients. HCE3

## Usage

HCE3

26 HCE4

#### **Format**

a data frame with 1000 rows and 6 variables:

ID subject ID, numbers from 1 to 1000

TRTP treatment values, A Active or P Placebo, character

GROUP type of the event, either Time-To-Event (TTE) or Continuous (C), character

**GROUPN** type of the event, for the ordering of outcomes in the GROUP variable, numeric

**AVALT** the timing of the time-to-event outcomes, numeric

**AVAL0** original values for each type of the event, time for TTE outcomes, numeric values for Continuous outcomes, numeric

**AVAL** AVAL = AVAL0 + GROUPN, ordinal analysis values for the HCE analysis. For the continuous outcome the values of AVAL0 are shifted to start always from 0. Numeric, but caution NOT to apply numeric operations; will give meaningless results

**PADY** primary analysis day, the length of fixed follow-up in days, numeric

HCE4

HCE1, HCE2, HCE3, HCE4 datasets for 1000 patients with different treatment effects.

#### **Description**

A simulated dataset containing the ordinal values and other attributes for 1000 patients. HCE4

#### Usage

HCE4

#### **Format**

a data frame with 1000 rows and 6 variables:

**ID** subject ID, numbers from 1 to 1000

TRTP treatment values, A Active or P Placebo, character

**GROUP** type of the event, either Time-To-Event (TTE) or Continuous (C), character

**GROUPN** type of the event, for the ordering of outcomes in the GROUP variable, numeric

**AVALT** the timing of the time-to-event outcomes, numeric

**AVAL0** original values for each type of the event, time for TTE outcomes, numeric values for Continuous outcomes, numeric

**AVAL** AVAL = AVAL0 + GROUPN, ordinal analysis values for the HCE analysis. For the continuous outcome the values of AVAL0 are shifted to start always from 0. Numeric, but caution NOT to apply numeric operations; will give meaningless results

**PADY** primary analysis day, the length of fixed follow-up in days, numeric

IWP 27

IWP

Calculates patient-level individual win proportions

## **Description**

Calculates patient-level individual win proportions

#### Usage

```
IWP(data, AVAL, TRTP, ref)
```

#### **Arguments**

data a data frame containing subject-level data.

AVAL variable in the data with ordinal analysis values.

TRTP the treatment variable in the data.

ref the reference treatment group.

#### Value

the input data frame with a new column of individual win proportions named using the input AVAL value with \_.

#### References

Gasparyan SB et al. "Adjusted win ratio with stratification: calculation methods and interpretation." Statistical Methods in Medical Research 30.2 (2021): 580-611. doi:10.1177/0962280220942558

```

28 KHCE

**KHCE** 

Kidney Hierarchical Composite Endpoint dataset.

#### Description

A dataset with kidney ordinal scale outcomes of 1500 patients in the ADSL dataset.

## Usage

**KHCE** 

#### **Format**

a data frame with 1500 rows and 11 variables:

**ID** patient identifiers, numeric

TRTPN treatment values, 1 Active or 2 Placebo, numeric

**AVAL0** original values for each type of the event, time for TTE outcomes 1-6, numeric values for Continuous outcome 7, numeric

**AVAL** AVAL = AVAL0 + GROUPN, ordinal analysis values for the HCE analysis, numeric, but caution NOT to apply numeric operations; will give meaningless results

**GROUP** name of the event, character

GROUPN ordinal outcomes corresponding to PARAMN values, numeric

PARAMCD coded name of the event, character

**PARAMN** severity of the event, outcomes 1-7, where a higher value means a better outcome, character

STRATAN strata 1-4, higher value means more severe kidney disease, numeric

EGFRBL Baseline GFR values of patients, numeric

TRTP treatment values, A Active or P Placebo, character

PADY primary analysis day (in years), length of the fixed follow-up, numeric

## Source

Heerspink HL et al "Development and validation of a new hierarchical composite endpoint for clinical trials of kidney disease progression." Journal of the American Society of Nephrology (2023): doi:10.1681/ASN.0000000000000243.

```
# Adjusted win odds
res <- regWO(x = KHCE, AVAL = "AVAL", TRTP = "TRTP", COVAR = "STRATAN", ref = "P")
res</pre>
```

minWO 29

minWO	Minimum detectable or WO for alternative hypothesis for given power (no ties)

## Description

Minimum detectable or WO for alternative hypothesis for given power (no ties)

#### Usage

```
minWO(N, power = 0.5, SD = NULL, k = 0.5, alpha = 0.05, WOnull = 1, digits = 2)
```

## Arguments

N	a numeric vector of sample size values (two arms combined).
power	the given power. The default is $0.5$ corresponding to the minimum detectable win odds. A numeric vector of length $1$ .
SD	assumed standard deviation of the win proportion. By default uses the conservative SD. A numeric vector of length $1.$
k	proportion of active group in the overall sample size. Default is $0.5$ (balanced randomization). A numeric vector of length $1.$
alpha	the significance level for the 2-sided test. Default is $0.05$ . A numeric vector of length 1.
WOnull	the win odds value of the null hypothesis (default is 1). A numeric vector of length $1.$
digits	precision to use for reporting calculated win odds.

## Value

a data frame containing the calculated WO with input values.

#### References

Gasparyan SB et al. (2021) "Power and sample size calculation for the win odds test: application to an ordinal endpoint in COVID-19 trials." Journal of Biopharmaceutical Statistics 31.6: 765-787. doi:10.1080/10543406.2021.1968893

#### **Examples**

```
\label{eq:minwo} \begin{split} & \text{minWO}(N = 100, \text{ digits} = 5) \\ & \text{minWO}(N = 1200, \text{ power} = 0.9, \text{ k} = 0.75) \\ & \# \text{ Compare the minimum detectable win odds from shifted alternatives to max and ordered alternatives} \\ & \text{WO} <- & \text{minWO}(N = 1200, \text{ k} = 0.5, \text{ power} = 0.67, \text{ digits} = 7)$WO \\ & \text{powerWO}(N = 1200, \text{ WO} = \text{WO}, \text{ k} = 0.5, \text{ alternative} = "shift") \\ & \text{powerWO}(N = 1200, \text{ WO} = \text{WO}, \text{ k} = 0.5, \text{ alternative} = "ordered") \\ & \text{powerWO}(N = 1200, \text{ WO} = \text{WO}, \text{ k} = 0.5, \text{ alternative} = "max") \\ \end{split}
```

plot.hce

A plot method for hce objects

#### **Description**

Ordinal dominance graph for hee objects

#### Usage

```
## S3 method for class 'hce'
plot(x, fill = FALSE, ...)
```

#### **Arguments**

```
x an object of class hee created by as_hee().

fill logical; if TRUE fill the area above the graph.
... additional arguments to be passed to base::plot() function.
```

#### Value

no return value, called for plotting.

#### References

Bamber D. "The area above the ordinal dominance graph and the area below the receiver operating characteristic graph." Journal of Mathematical Psychology 12.4 (1975): 387-415. doi:10.1016/0022-2496(75)90001-2

plot.hce\_results 31

plot.hce\_results

A print method for hce\_results objects

## **Description**

A print method for hce\_results objects

## Usage

```
## S3 method for class 'hce_results'
plot(x, ...)
```

#### **Arguments**

```
x an object of class hce_results.... additional arguments to be passed to base::plot() function.
```

#### Value

no return value, called for plotting.

## **Examples**

```
WO <- minWO(N = 100:1000)
plot(WO)
POW <- powerWO(N = 100:1000, WO = 1.2)
plot(POW, ylim = c(0, 1))
```

powerW0

Power calculation for the win odds test (no ties)

## **Description**

Power calculation for the win odds test (no ties)

## Usage

```
powerWO(
    N,
    WO,
    SD = NULL,
    k = 0.5,
    alpha = 0.05,
    WOnull = 1,
    alternative = c("shift", "max", "ordered")
)
```

32 powerWO

#### Arguments

N	a numeric vector of sample size values.
WO	the given win odds for the alternative hypothesis. A numeric vector of length 1.
SD	assumed standard deviation of the win proportion. By default uses the conservative SD. A numeric vector of length 1.
k	proportion of active group in the overall sample size. Default is $0.5$ (balanced randomization). A numeric vector of length $1.$
alpha	the significance level for the 2-sided test. Default is $0.05$ . A numeric vector of length 1.
WOnul1	the win odds value of the null hypothesis (default is 1). A numeric vector of length $1.$
alternative	a character string specifying the class of the alternative hypothesis, must be one of "shift" (default), "max" or "ordered". You can specify just the initial letter.

#### **Details**

alternative = "max" refers to the maximum variance of the win proportion across all possible alternatives. The maximum variance equals WP\*(1-WP)/k where the win probability is calculated as WP = WO/(WO + 1). alternative = "shift" specifies the variance across alternatives from a shifted family of distributions (Wilcoxon test). The variance formula, as suggested by Noether, is calculated based on the null hypothesis as follows 1/(12\*k\*(1-k)). alternative = "ordered" specifies the variance across alternatives from stochastically ordered distributions which include shifted distributions.

## Value

a data frame containing the calculated power with input values.

```

print.hce\_results

A print method for hce\_results objects

#### **Description**

A print method for hce\_results objects

## Usage

```
## S3 method for class 'hce_results'
print(x, ...)
```

## **Arguments**

```
x an object of class hce_results.
```

... additional arguments to be passed to base::print() function.

#### Value

no return value, called for printing.

```
print(powerWO(N = 1000, WO = 1.2))
```

34 propWINS

propWINS

Proportion of wins/losses/ties given the win odds and the win ratio

#### **Description**

Proportion of wins/losses/ties given the win odds and the win ratio

#### Usage

```
propWINS(WO, WR, Overall = 1, alpha = NULL, N = NULL)
```

#### **Arguments**

WO win odds. WR win ratio.

Overall number of comparisons, the sample size of the active treatment multiplied by

the sample size of the placebo. The default is 1, hence gives the proportion.

alpha significance level for the win ratio confidence interval. The default is NULL hence

the confidence interval is not produced.

the combined sample size of two treatment groups. The default is NULL. If alpha Ν

is specified then either N should be specified or Overall > 1. For given Overall,

the pooled sample size is calculated as N = 2\*sqrt(Overall).

## **Details**

 $\begin{array}{l} \bullet \ \ \mbox{Win ratio defined as} \ WR = \frac{W}{L}. \\ \bullet \ \mbox{Win odds defined as} \ WO = \frac{W+0.5T}{L+0.5T} = \frac{WP}{1-WP}. \\ \bullet \ \mbox{Net Benefit defined as} \ NB = \frac{W-L}{0}. \end{array}$ 

Given the overall number of comparisons O, the win proportion WP and the win ratio WR, it is possible to find the total number of wins and losses. Indeed, first the win odds can be found  $WO = \frac{WP}{WP+1}$  and

$$\begin{split} L &= O * \frac{2WP - 1}{WR - 1}, \\ W &= WR * O * \frac{2WP - 1}{WR - 1}, \\ T &= O - W - L. \end{split}$$

#### Value

a data frame with a number (or proportion if Overall = 1) of wins/losses/ties. If alpha is specified returns also WR confidence interval.

## **Examples**

```
# Example 1
propWINS(WR = 2, WO = 1.5)
# Example 2 - Back-calculation
COVID19HCE <- hce(GROUP = COVID19$GROUP, TRTP = COVID19$TRTP)
res <- calcwINS(COVID19HCE)
WR <- res$WR1$WR
WO <- res$W0$WO
Overall <- res$summary$TOTAL
propWINS(WR = WR, WO = WO, Overall = Overall)
## Verify
res$summary
# Example 3 - Confidence interval
propWINS(WR = 1.4, WO = 1.3, alpha = 0.05, Overall = 2500)
propWINS(WR = 2, WO = 1.5, alpha = 0.01, N = 500)</pre>
```

regW0

A generic function for win odds regression

## **Description**

A generic function for win odds regression

## Usage

```
regWO(x, ...)
```

#### **Arguments**

x an object used to select a method.

... further arguments passed to or from other methods.

## Value

a data frame containing calculated values.

36 regWO.data.frame

#### See Also

regWO.data.frame(), regWO.formula() methods.
```

regWO.data.frame

Win Odds Regression Using a Data Frame

#### Description

This function performs regression analysis for the win odds using a single numeric covariate.

#### Usage

```
## S3 method for class 'data.frame'
regWO(x, AVAL, TRTP, COVAR, ref, alpha = 0.05, WOnull = 1, ...)
```

## **Arguments**

x a data frame containing subject-level data.

AVAL a variable in the data with ordinal analysis values.

TRTP the treatment variable in the data.

COVAR a numeric covariate.

ref the reference treatment group.

alpha the significance level, with a default value of 0.05.

WOnull the null hypothesis value for win odds. The default is 1.

. . . additional parameters.

#### Value

a data frame containing the calculated win odds and its confidence interval, including:

- WO beta adjusted win odds.
- LCL lower confidence limit for adjusted WO.
- UCL upper confidence limit for adjusted WO.
- SE standard error of the adjusted win odds.
- WOnull win odds of the null hypothesis (specified in the WOnull argument).
- alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).
- Pvalue p-value associated with testing the null hypothesis.
- N total number of patients in the analysis.
- beta adjusted win probability.
- LCL\_beta lower confidence limit for adjusted win probability.
- UCL\_beta upper confidence limit for adjusted win probability.

regWO.formula 37

- SE\_beta standard error for the adjusted win probability.
- SD\_beta standard deviation for the adjusted win probability.
- WP (non-adjusted) win probability.
- SE\_WP standard error of the non-adjusted win probability.
- SD\_WP standard deviation of the non-adjusted win probability.
- WO non-adjusted win odds.
- COVAR\_MEAN\_DIFF mean difference between two treatment groups of the numeric covariate.
- COVAR\_VAR sum of variances of two treatment groups of the numeric covariate.
- COVAR\_COV covariance between the response and the numeric covariate.

```

regWO.formula

Win Odds Regression Using a Formula Syntax

#### **Description**

This function performs regression analysis for the win odds using a single numeric covariate.

#### Usage

```
## S3 method for class 'formula'
regWO(x, data, ...)
```

38 regWO.formula

#### Arguments

x an object of class formula.

data a data frame.

... additional parameters.

#### Value

a data frame containing the calculated win odds and its confidence interval, including:

- WO\_beta adjusted win odds.
- LCL lower confidence limit for adjusted WO.
- UCL upper confidence limit for adjusted WO.
- SE standard error of the adjusted win odds.
- WOnull win odds of the null hypothesis (specified in the W0null argument).
- alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).
- Pvalue p-value associated with testing the null hypothesis.
- N total number of patients in the analysis.
- beta adjusted win probability.
- LCL\_beta lower confidence limit for adjusted win probability.
- UCL\_beta upper confidence limit for adjusted win probability.
- SE\_beta standard error for the adjusted win probability.
- SD\_beta standard deviation for the adjusted win probability.
- WP (non-adjusted) win probability.
- SE\_WP standard error of the non-adjusted win probability.
- SD\_WP standard deviation of the non-adjusted win probability.
- WO non-adjusted win odds.
- COVAR\_MEAN\_DIFF mean difference between two treatment groups of the numeric covariate.
- COVAR\_VAR sum of variances of two treatment groups of the numeric covariate.
- COVAR\_COV covariance between the response and the numeric covariate.
- formula returning the specified formula in the x argument.
- ref showing how the reference group was selected. Can be modifying by specifying the ref argument.

simHCE

Simulate hee object with given event rates of time-to-event outcomes (Weibull), mean and SD of the continuous outcome (normal or lognormal) by treatment group

## **Description**

Simulate hee object with given event rates of time-to-event outcomes (Weibull), mean and SD of the continuous outcome (normal or log-normal) by treatment group

# Usage

```
simHCE(
 n,
 n0 = n,
 TTE_A,
 TTE_P,
 CM_A,
 CM_P,
 CSD_A = 1,
 CSD_P = CSD_A,
  fixedfy = 1,
 yeardays = 360,
 pat = 100,
  shape = 1,
  theta = 1,
  logC = FALSE,
  seed = NULL,
 dec = 2,
  all_data = FALSE
)
```

# Arguments

n	sample size in the active treatment group.
n0	sample size in the placebo group.
TTE_A	event rates per year in the active group for the time-to-event outcomes.
TTE_P	event rates per year in the placebo group for the time-to-event outcomes. Should have the same length as TTE_A.
CM_A	mean value for the continuous outcome of the active group.
CM_P	mean value for the continuous outcome of the placebo group.

40 simHCE

CSD_A	standard deviation for the continuous outcome of the active group.	
CSD_P	standard deviation for the continuous outcome of the placebo group.	
fixedfy	length of follow-up in years.	
yeardays	number of days in a year.	
pat	scale of provided event rates (per pat-years).	
shape	shape of the Weibull distribution for time-to-event outcomes. Default is exponential distribution with shape = 1.	
theta	Gumbel dependence coefficient of the Weibull distributions for time-to-event outcomes. Default is theta = 1 which assumes independence of time-to-event outcomes. Must be above or equal to 1.	
logC	logical, whether to use log-normal distribution for the continuous outcome.	
seed	for generating random numbers.	
dec	decimal places for the continuous outcome used for rounding. The default is dec = 2.	
all_data	logical, whether to return source datasets ADET (an event-time dataset for all time-to-event outcomes per patient) and BDS (a basic data structure for the continuous outcome for all patients).	

#### Value

an object of class hee containing the following columns:

- ID subject identifier.
- TRTP planned treatment group "A" for active, "P" for Placebo.
- GROUP type of the outcome, either "TTE" for time-to-event outcomes or "C" for continuous. Only one continuous outcome is possible, but no restriction on the number of "TTE" outcomes.
- GROUPN order of outcomes in GROUP, with a higher value signifying a better outcome.
- AVALT the timing of the time-to-event outcomes.
- AVAL0 numeric values of the continuous outcome and the timing of "TTE" outcomes.
- AVAL analysis values derived as AVAL0 + GROUPN. For the continuous outcome the values of AVAL0 are shifted to start always from 0.
- seed the seed of the random sample. If not specified in seed argument will be selected based on system time.
- PADY primary analysis day, the length of fixed follow-up in days calculated as yeardays multiplied by fixedfy.

If all\_data = TRUE, the function returns a list containing the hce dataset, along with its source datasets: ADET (an event-time dataset for all time-to-event outcomes per patient) and BDS (a basic data structure for the continuous outcome for all patients).

#### See Also

#### **Examples**

```
# Example 1
Rates_A <- c(1.72, 1.74, 0.58, 1.5, 1)
Rates_P <- c(2.47, 2.24, 2.9, 4, 6)
dat <- simHCE(n = 2500, TTE_A = Rates_A, TTE_P = Rates_P,</pre>
              CM_A = -3, CM_P = -6, CSD_A = 16, CSD_P = 15, fixedfy = 3)
head(dat)
# Example 2
Rates_A <- 10
Rates_P <- 15
dat <- simHCE(n = 1000, n0 = 500, TTE_A = Rates_A, TTE_P = Rates_P,
              CM_A = 0.1, CM_P = 0, seed = 5, shape = 0.2, logC = TRUE, dec = 0)
summaryWO(dat)
# Example 3: Comparison of dependent and independent outcomes
Rates_A <- c(10, 20)
Rates_P <- c(20, 20)
dat1 <- simHCE(n = 2500, TTE_A = Rates_A, TTE_P = Rates_P,</pre>
CM_A = -3, CM_P = -6, CSD_A = 15, fixedfy = 3, theta = 1, seed = 1)
dat2 <- simHCE(n = 2500, TTE_A = Rates_A, TTE_P = Rates_P,</pre>
CM_A = -3, CM_P = -6, CSD_A = 15, fixedfy = 3, theta = 1.0001, seed = 1)
calcWO(dat1)
calcWO(dat2)
```

simKHCE

Simulate a kidney disease hce dataset

## **Description**

Simulate a kidney disease hee dataset, capturing eGFR (Estimated Glomerular Filtration Rate) progression over time, along with a competing and dependent terminal event: KFRT (Kidney Failure Replacement Therapy)

#### Usage

```
simKHCE(
    n,
    CM_A,
    CM_P = -4,
    n0 = n,
    TTE_A = 10,
    TTE_P = TTE_A,
    fixedfy = 2,
    Emin = 20,
    Emax = 100,
    sigma = 8,
    Sigma = 3,
```

42 simKHCE

```
m = 10,
theta = -0.23,
phi = 0
)
```

#### **Arguments**

n sample size in the active treatment group. annualized eGFR slope in the active group. CM\_A CM P annualized eGFR slope in the control group. n0 sample size in the control treatment group. TTE\_A event rate per year in the active group for KFRT. TTE\_P event rate per year in the placebo group for KFRT. fixedfy length of follow-up in years. Emin lower limit of eGFR at baseline. upper limit of eGFR at baseline. **Emax** within-patient standard deviation. sigma between-patient standard deviation. Sigma number of equidistant visits. theta coefficient of dependence of eGFR values and the risk of KFRT. phi coefficient of proportionality (between 0 and 1) of the treatment effect. The case of 0 corresponds to the uniform treatment effect.

#### **Details**

The default setting is TTE\_A = TTE\_P because, conditional on eGFR level, the treatment effect does not influence the event rate of KFRT. In this model, the effect of treatment on KFRT operates entirely through its impact on eGFR decline.

The parameters TTE\_A and theta are chosen so that when GFR is 10, the event rate is 1 per year, and when GFR is 30, the event rate is 0.01 per year. These parameter values are obtained by solving the equation rate0\*exp(GFR\*theta) = rate for rate0 and theta.

#### Value

a list containing the dataset GFR for longitudinal measurements of eGFR and the competing KFRT events, the dataset ADET for the time-to-event kidney outcomes (sustained declines or sustained low levels of eGFR), and the combined HCE dataset for the kidney hierarchical composite endpoint.

#### See Also

simHCE() for a general function of simulating hce datasets.

simORD 43

## **Examples**

```
# Example 1
set.seed(2022)
L <- simKHCE(n = 1000, CM_A = -3.25)
dat <- L$HCE
calcWO(dat)</pre>
```

simORD

Simulate ordinal variables for two treatment groups using categorization of beta distributions

# Description

Simulate ordinal variables for two treatment groups using categorization of beta distributions

## Usage

```
simORD(n, n0 = n, M, alpha1 = 8, beta1 = 7, alpha0 = 5, beta0 = 5)
```

# Arguments

n	sample size in the active treatment group.
n0	sample size in the placebo group.
М	number of ordinal values to be simulated.
alpha1	shape1 parameter for the beta distribution in the active group.
beta1	shape2 parameter for the beta distribution in the active group.
alpha0	shape1 parameter for the beta distribution in the placebo group.
beta0	shape2 parameter for the beta distribution in the placebo group.

# Value

a data frame containing the following columns:

- ID subject identifier.
- TRTP planned treatment group "A" for active, "P" for Placebo.
- GROUPN ordinal values. The number of unique values is specified by the variable M0.
- tau the theoretical win odds.
- theta the theoretical win probability.

sizeW0

Sample size calculation for the win odds test (no ties)

#### Description

Sample size calculation for the win odds test (no ties)

sizeWO 45

#### Usage

```
sizeWO(
    WO,
    power,
    SD = NULL,
    k = 0.5,
    alpha = 0.05,
    WOnull = 1,
    alternative = c("shift", "max", "ordered")
)
```

## Arguments

WO	a numeric vector of win odds values.
power	the given power. A numeric vector of length 1.
SD	assumed standard deviation of the win proportion. By default uses the conservative SD. A numeric vector of length 1.
k	proportion of active group in the overall sample size. Default is $0.5$ (balanced randomization). A numeric vector of length $1.$
alpha	the significance level for the 2-sided test. Default is $0.05$ . A numeric vector of length 1.
WOnul1	the win odds value of the null hypothesis (default is 1). A numeric vector of length 1.
alternative	a character string specifying the class of the alternative hypothesis, must be one of "shift" (default), "max" or "ordered". You can specify just the initial letter.

#### **Details**

alternative = "max" refers to the maximum variance of the win proportion across all possible alternatives. The maximum variance equals WP\*(1-WP)/k where the win probability is calculated as WP = WO/(WO + 1). alternative = "shift" specifies the variance across alternatives from a shifted family of distributions (Wilcoxon test). The variance formula, as suggested by Noether, is calculated based on the null hypothesis as follows 1/(12\*k\*(1-k)). alternative = "ordered" specifies the variance across alternatives from stochastically ordered distributions which include shifted distributions.

#### Value

a data frame containing the sample size with input values.

stratWO.data.frame

Stratified win odds with adjustment

# **Description**

Stratified win odds with adjustment

# Usage

```
## $3 method for class 'data.frame'
stratWO(
    X,
    AVAL,
    TRTP,
    STRATA,
    ref,
    COVAR = NULL,
    alpha = 0.05,
    WOnull = 1,
    ...
)
```

## **Arguments**

a data frame containing subject-level data. Х AVAL variable in the data with ordinal analysis values. TRTP the treatment variable in the data. STRATA a character variable for stratification. ref the reference treatment group. COVAR a numeric covariate. alpha the reference treatment group. W0null the null hypothesis. The default is 1. additional parameters.

stratWO.data.frame 49

#### Value

a data frame containing the following columns:

- WO stratified (or adjusted/stratified) win odds.
- LCL lower confidence limit for adjusted (or adjusted/stratified) WO.
- UCL upper confidence limit for adjusted (or adjusted/stratified) WO.
- SE standard error of the adjusted (or adjusted/stratified) win odds.
- WOnull win odds of the null hypothesis (specified in the WOnull argument).
- alpha two-sided significance level for calculating the confidence interval (specified in the alpha argument).
- Pvalue p-value associated with testing the null hypothesis.
- WP adjusted (or adjusted/stratified) win probability.
- LCL\_WP lower confidence limit for adjusted (or adjusted/stratified) WP.
- UCL\_WP upper confidence limit for adjusted (or adjusted/stratified) WP.
- SE WP standard error for the adjusted (or adjusted/stratified) win probability.
- SD\_WP standard deviation of the adjusted (or adjusted/stratified) win probability.
- N total number of patients in the analysis.
- Type "STRATIFIED" or "STRATIFIED/ADJUSTED" depending on whether COVAR is specified.

summary WO. adhce 51

summaryWO.adhce

Win odds summary for adhce objects

## **Description**

Win odds summary for adhce objects

# Usage

```
## S3 method for class 'adhce' summaryWO(x, ...)
```

## Arguments

```
x an adhce object.
```

... additional parameters.

#### Value

a list containing the summary of wins, losses, and ties. It contains the following named objects:

- summary a data frame containing number of wins, losses, and ties by treatment group and the overall number of comparisons.
- summary\_by\_GROUP (if GROUP variable is specified) a summary data frame by GROUP.
- WO calculated WO (win odds) and WP (win probability) and their standard errors.

```

```
dat <- as_hce(HCE4)
## `PADY` is not present in the dataset, hence converts it to an `hce` object
## instead of an `adhce` object.
class(dat)
summaryWO(dat, ref = "P")
## The class is `adhce` hence will use the variable `GROUP`.
HCE4$PADY <- 1080
dat <- as_hce(HCE4)
class(dat)
summaryWO(dat, ref = "P")</pre>
```

```
summaryWO.data.frame Win odds summary for a data frame
```

# Description

Win odds summary for a data frame

## Usage

```
## S3 method for class 'data.frame'
summaryWO(x, AVAL, TRTP, ref, GROUP = NULL, ...)
```

# Arguments

X	a data frame containing subject-level data.
AVAL	variable in the data with ordinal analysis values.
TRTP	the treatment variable in the data.
ref	the reference treatment group.
GROUP	an optional variable for grouping.
	additional parameters.

#### Value

a list containing the summary of wins, losses, and ties. It contains the following named objects:

- summary a data frame containing number of wins, losses, and ties by treatment group and the overall number of comparisons.
- summary\_by\_GROUP (if GROUP variable is specified) a summary data frame by GROUP.
- WO calculated WO (win odds) and WP (win probability) and their standard errors.

```

summary WO. formula 53

summaryWO.formula

Win odds summary using formula syntax

# Description

Win odds summary using formula syntax

## Usage

```
## S3 method for class 'formula'
summaryWO(x, data, ...)
```

## **Arguments**

```
x an object of class formula.data a data frame.additional parameters.
```

#### Value

a list containing the summary of wins, losses, and ties. It contains the following named objects:

- summary a data frame containing number of wins, losses, and ties by treatment group and the overall number of comparisons.
- WO calculated WO (win odds) and WP (win probability) and their standard errors.
- formula returning the specified formula in the x argument.
- ref showing how the reference group was selected. Can be modifying by specifying the ref argument.

summaryWO(data = COVID19, GROUP ~ TRTP, GROUP = "GROUP", ref = "Placebo")
```

54 summary WO.hce

summaryWO.hce

Win odds summary for hce objects

# Description

Win odds summary for hce objects

# Usage

```
## S3 method for class 'hce' summaryWO(x, ...)
```

# Arguments

x an hce object.

... additional parameters.

#### Value

a list containing the summary of wins, losses, and ties. It contains the following named objects:

- summary a data frame containing number of wins, losses, and ties by treatment group and the overall number of comparisons.
- WO calculated WO (win odds) and WP (win probability) and their standard errors.
